

Graver Technologies

PRODUCT STORAGE RECOMMENDATIONS

1. When the shipment arrives, inspect the containers for signs of breakage or other damage. Do not use material from open or broken containers. Set it aside and contact Graver for instructions.
2. Arrange the storage area to insure that the oldest material will be used first. Do not open containers until ready for use.
3. Products should be stored at temperatures between 39°F/4°C - 120°F/49°C.
4. The storage area must be dry and protected from weather, chemicals and vermin. Bead resin products will suffer physical deterioration if allowed to freeze. Freezing will not damage precoat resin products. Any frozen precoat resin product should be thawed before use.
5. Pallets must not be stacked more than two (2) high. Storage should be in a low traffic area to avoid damage to containers from forklift trucks or other handling equipment.
6. Shelf life of products may vary due to product type, ionic form and physical characteristics.
7. Contact Graver's Customer Service Dept. or your regional sales representative for further technical assistance on storage and shelf life of Graver products.
